SUBJECT: DRAFT IDEAS – THOUGHTS AND NOTES TO TAKE INSPIRATION

Dear USA Citizens,

I leave you a list of thoughts, draft ideas and notes to take inspiration. I hope someone could produce something new.

PROJECTS

FOCUS PROJECTS IN AN AMERICAN ENVOIRENMENT – INTO WHICH ADD OTHER PROJECTS AND IDEA ON PAPERS

1. Supervisory agency and headquarters with remote control of territorial video surveillance;

2. Patent an anti-theft system that is thief-proof-for example, trying to create a watertight enclosure to protect the control unit-inaccessible except from the parent company or authorized workshop, and electronically integrate an anti-jamming system that forewarns us of attempted jamming networks (jamming). To think of a possible solution (Plan B) in case they still manage to gain access to the interior of the passenger compartment-for example, by incorporating a system of smoke sleepers that are activated only when a sensor detects presence inside and if and only if the car is moving. To avoid malfunction during normal owner use create additional authentication that recognizes the owner and disables the system. ();

3. Complex of professional activities - multi-story building with stained glass and modern. business and strategic territorial consulting, accountant, law firm with various branches of specialization, engineering and architecture firm, occupational safety and medicine, training courses - unique all-glass building where each apartment has its own expertise - possible opportunity could be chicory furnishings building in for sale (consistent features);
4. Marketing/digital marketing company to promote local brands regionally, south and nationally (increase in revenue);
5. Waste storage, recycling and disposal plant/industrial sludge- with ioT , 4.0 and nine technologies and sensor systems such that waste and excesses are avoided under conveyor belts or under storage/silos;
6. Founding business intelligence company - data analysis;

7. Nursing and/or retirement home for elderly and frail individuals;
8. Harvesting of local products and subsequent processing - packaging and marketing on the market (chips with apples or dried pears - chopped salami hams etc)
9. Recovery of plastics (agricultural - urban) and subsequent recycling with production of new products for industrial use such as tarpaulins, conveyor belts, tents for home, indoor and outdoor use, umbrella covers, tarpaulins for tarpaulin trailers etc;
10. Realization of new vineyard - high quality vine (or take it back from already made vineyards) and make a winery. monitoring and control of fertigation using 4.0 (IoT) systems based on certain parameters such as temperature humidity and soil condition to prevent the combination of several factors can lead to the proliferation of pests and diseases to the plant.
11. Making a new brand of clothing/shoes using plastics/fibers/cotton/recycled materials (it is necessary to identify which suppliers can supply such raw materials-whether it is worthwhile at the same time to set up a factory to do this (own production) or through external suppliers;
12. Realize online platform with logistics location of stationery, office, office furniture, pc products. (Assess whether another similar case already exists in the South).
13. Realization of products with recycled wood and plastic - (example of ergonomic chair - simple realization)
14. Realize chain of places to eat fish, fried food and fish sandwiches using freshly caught fish. Guarantee the freshness of fish is daily replenishment by vans with suitable refrigerated case. Try to realize new types of “fusion” fish dishes and sandwiches.
15. Make a new combination-mix of meats and scraps derived from butchery to produce new dog/cat dishes;
16. Make disposable jars containing local products/cultures such as garlic, legume meal, vegetable creams or a mix of the same (evaluate vegetables grown in Apulia (to be found-ends up with ina)-also make a study of the properties of various vegetables and create products processed from them. For example, chicory, asparagus, fennel and so on;
17. Make a production company of gym products (protein, creatine, amino acids (BCCA) with purely Italian materials of a certain quality standard;
18. Realize aluminum-iron can factory derived from landfill and recycled materials. This will be integrated with a business branch that will take care of packaging of the same by recycling paper/cardboard and plastic (these two branches are assumed to be independent to allow different market needs to be met);
19. Build an open space for sharing pcs, internet etc with various areas to be able to study, program, design. Create competitive tournaments among certain groups with related prizes to encourage the emergence of business ideas and support the subsequent accompanying phase of the idea by creating

links and partnerships with companies. (incubator type).
20. Open massage centers of different types - single and couple - with provision for sauna and rehabilitation center.
21. Realize a roasting company with selection and processing of purely high quality beans. To study a new blend with a unique and inimitable taste. (Coffee that comes purely from South America or other place that traditionally grows coffee beans). Contextually provide a center for collection and recycling or reuse for other purposes of used coffee in all coffee shops and urban centers.
22. Create a wheat supply chain (starting with organic wheat from Palazzo and build a mill to make flour (of different uses-such as for cakes, pasta etc.) and later integrate with the creation of a pasta factory (with special attention to organoleptic components, trying to create a line dedicated to celiac, whole grain line and mix of different grains) and aim to open a cookie factory as well (see example DI Leo from Altamura).

PROJECTS TO BE IMPLEMENTED THROUGH USE OF FINTECH AND CURRENT SOLUTIONS (crowdfunding/access to microcredit etc.)

Tip: Look at the various master projects.

Begin to set filters based on various milestones-discriminating ideas that are likely to be less scalable and feasible, and closer to failure in the first period of life.

POTENTIALLY INNOVATIVE

1. Create a gym chain with innovative systems for connecting the machines and equipment, maintenance systems with failure prevention, pre- and post-workout relaxation area, massage and energy/gym product area with the possibility of getting a diet from an on-site professional - plan to use in combination the following project perhaps avoiding the professional (at least in direct contact with the client). In fact, it will proceed behind the scenes in drafting the automatic portal guidelines; **(see master project)**
2. Cryptocurrency mining with the possibility of installing and deploying ATMs for conversion to € and payment via app (the facility suitable for this activity must be predominantly equipped with photovoltaic panels that lower the energy cost of connected computers-preferably settle where FTTH/FTTC fiber is present;
3. Create an online portal and app for the creation of personalized diets in a fully automatic way, by entering one's personal data, habits, sports and hobbies, current weight and optimal weight etc and interfaced with android / ios watches for reading cardiac data, trying to prevent possible cardiovascular

issues. In case there is the previous risk automatically starts a call to 118 with sending location and phone cell you are hooked to - study a system that the moment this risk is found from the reading - injects by puncture a substance that can help ensure the exemption of permanent damage to the walls of blood vessels and other tissues of the heart affected or by shock that simulates the defibrillator - example a defibrillator under the skin (**complex but interesting project**);

4. Create a platform with associated yard used for parking electric cars. Indoor charging stations for business use and outdoor charging stations for public charging. Use of photovoltaics for power and charging. The cars should act as rental cars with drivers (also experimenting with those without such as tesla), providing service for people with disabilities, age-related difficulties and/or special needs. Implementation of dedicated app for reservation and related payment. (Let's G0!) (difficulty in scaling nationwide - purely regional or interregional);

5. Harvesting of fresh vegetables and fruits - bagging and sorting at various retail points; (study a product tracking system to file their entire travel phase - from harvesting - to wholesale market to retail - to avoid marketing fruits or vegetables that are old and hazardous to health;

6. Create an app for collecting daily spoiling food (such as bread, sandwiches, vegetables, fruits etc.) in all related activities, avoiding waste and raw material waste. Scooters or electric cars will be used for collection. From the app there will be the section for businesses or individuals who have the excess, and the user section who will be able to reserve such food, consumer goods at an obviously lower price given the upcoming spoilage. It will also be planned to donate it to the needy or associations.

7. Devise a mini-factory of products made with 3d printers - strictly using suitable plastic material derived from recycling. Also hypothesize the use of the metal addictive manufacturing technique used in f1 to make mechanical parts - to make metal or alloy products that are small in size or complementary to plastic products;

8. Opening cybersecurity companies for businesses;

9. Verify through market research if already present - create a new app for adoption of dogs and cats residing in kennels with photos and main information such as years - breed by acquiring information from a database (if available) otherwise plan to implement it as well.

10. Check if legal and not contrary to a certain legislation - make app that connects those who want to rent the uterus and those who want to make their fertility available. the future mother/parent who wants a child without having emotional ties can view a fac simile of the donor's information sheet without access to her name (age, nationality, height, weight, hereditary pathologies and diseases, photo physical appearance etc). Names, face, employment status must remain anonymous .

11. Make an electronic barcode or QR CODE reading device to be applied to refrigerators. Such a system must be patented to allow it to be applied to the entire chain of packaged food with an expiration date. The goal is to make an app that through the insertion of each food inside the refrigerator is detected the electronic expiration date and set an expiration calendar on the cell phone. The goal is to reduce the waste of expired food since many times we forget the expiration date and then are forced to throw it away.

12. An electronic device linked to all the cars to open them through your personal application using NFC. Obviously, you need to register all the data, GPS position, user, time of unlock and lock, device, Mac address, Face ID verification once a day in the car through the central display. I developed this idea in the 2016, during my fast year at the University in Bari but probably someone has stolen – as often happens in my life – or even rejected for jealousy of someone has read it. It was a Fiat Chrysler survey conducted in the University.

1. Warehouses in USA – keys in hand – empty inside – verify all the costs about that and if it's convenient or not. Find the best place where many businesses open and pick it there while I will opening a business in one of E-residency places (Estonia-Azerbaijan)

I hope to have done well for the country where I wished to live and enjoy my life but someone has stroken it prematurely driven by envy I left Italy, you know, this is Italy. Just to remember you all if in the future you would consider USA a dangerous place where to live. Often, in the rest of the world, above all in Italy, many of cruel things are well covered to don't appear bad in the world but in the facts it's plenty of more dangerous than USA. At least, there is public and known what's not working.

Yours faithfully,

Giuseppe Buonconsiglio
